

A functional environmentally safe plastic, designed for the circular economy

Aquapak's Hydropol™ is a specially engineered material that can create a range of packaging products that are designed to eliminate plastic pollution at source

Packing and Shipping of Blown Film Products

Hydropol is sensitive to water and so should be packed in polythene bags for storage and shipping. Outer packaging must be resealed after opening to protect against moisture.

Outer packing should undergo a validation process to ensure fitness for purpose.

Hydropol film is not suitable for vacuum packing.

Packing of Garments into Hydropol Garment Bags

Please bear in mind that Hydropol is designed to dissolve in hot water, therefore it is best stored and handled in cool, dry conditions.

- Keep outer packaging sealed until the garment bags are required;
- Bags should be handled with dry hands;
- Garments should be cool and dry before packing;
- Put the garment into the garment bag;
- Place a master poly bag into the box before putting the stuffed garment bags;
- Seal the master poly bag as soon as possible.

A handwritten signature in black ink, appearing to read "E. Smith".
